CRYPTO

Bitcoin (BTC)

BTC trades near \$62,500, approximately 50% off the October 2025 all-time high of \$126,198. The \$60,000 level is the critical support zone; below that, \$55,000-\$58,000 is the next reference area. The 200-day MA has been declining since early May, acting as overhead resistance alongside the 50-day MA.

On-chain: funding rates on perpetuals are neutral to slightly negative, indicating leveraged speculation has partially flushed. MVRV has not yet reached historically reliable accumulation territory. ETF-driven outflows (largest of 2026 at \$1.67B weekly) are creating direct sell pressure; a reversal of that flow would be a meaningful near-term catalyst.

Ethereum (ETH)

ETH is trading around \$1,700-\$1,800, down roughly 29% in Q1 2026 alone and continuing to underperform BTC on this correction. Market cap is approximately \$230-235B. The Glamsterdam upgrade is on the roadmap but subject to timeline adjustments; do not treat it as a near-term price catalyst without confirmation. Layer-2 adoption and DeFi fee revenues remain structurally intact.

Hyperliquid (HYPE): Cycle Outlier

HYPE recently printed an all-time high, one of the only assets to do so during a period of extreme fear. The decentralized perpetuals exchange is processing billions in daily open interest with real volume and fee revenue. ETF products from Bitwise, 21Shares, and Grayscale have launched around the ecosystem.

Current support: ~\$56. Secondary accumulation zone: \$38-\$44 if broader market pressure continues. ATH during extreme fear is a meaningful divergence signal.

Altcoin Landscape

Speculative altcoins broadly under pressure; capital concentrating in higher-quality assets. Notable watches: AI tokens (Bittensor, Render, Venice) approaching historical accumulation zones; RWA tokens (Ondo, Canton) holding relatively better on the tokenization thesis. Position sizing matters more than narrative selection in this environment.

MACRO

May NFP: 172K vs. 85K Expected

Friday's nonfarm payrolls report was a blowout: 172,000 jobs added against a consensus of 85,000. Unemployment held at 4.3%; wage growth 3.4% YoY in line. A labor market this resilient, combined with elevated oil-driven inflation, removes any near-term justification for Fed rate cuts. June hold probability: 99.4%. The more significant shift: markets are now pricing a ~73% chance of a rate hike by year-end.

Equities: Nasdaq -4.18% on Friday

The Nasdaq fell 4.18% on Friday (worst day since April 2025); S&P; 500 -2.64% to 7,383; Dow -695 points. Catalyst: semiconductor sector breakdown after Broadcom failed to raise its AI chip outlook Wednesday night. NFP-driven treasury yield spike accelerated the selloff. VIX +39.68%. The S&P; had briefly crossed 7,600 earlier in the week on chip/AI enthusiasm.

Oil and Geopolitics

WTI crude: ~\$90-94/bbl. Brent: ~\$96-97/bbl. Down from the April peak of \$138 but still historically elevated. The near-closure of the Strait of Hormuz and ~10.5M b/d of forced Middle Eastern shut-ins in April created a supply shock the market is still absorbing. Saudi Aramco CEO: full normalization takes until 2027 even if the Strait reopens today.

Geopolitical status: Iran launched missiles toward Israel over the weekend (all intercepted). Hezbollah rejected ceasefire. 60-day truce framework stalled. OPEC+ approved +188,000 b/d July quota increase. UAE departed OPEC May 1, reducing cartel spare capacity from 3.8M to 2.5M b/d. EIA STEO update due June 9.

Gold and Dollar

Gold dropped to \$4,370/oz on Friday, the 2026 YTD low, on a -3.8% weekly decline. The NFP-driven treasury yield spike raised the opportunity cost of holding gold. Institutional year-end targets remain \$5,400-\$6,300 but near-term path is lower while rate hike expectations persist. USD Index at ~100, firm but range-bound. A stronger dollar creates direct headwinds for crypto and risk assets broadly.

Key Risks This Week: Hot CPI print accelerates rate-hike pricing and hits risk assets hard; further US-Iran escalation reignites oil spike and inflation narrative; continued ETF outflows push BTC below \$60K support; semiconductor selloff extends into broader tech; HYPE faces correlation risk if BTC breaks support.

Potential Catalysts: CPI surprise to the downside creates relief rally across crypto and equities; credible US-Iran diplomatic breakthrough sends oil lower and unlocks risk appetite; post-holiday ETF flow reversal provides near-term BTC support; Fed language stays cautious on hikes despite hot NFP, capping rate-hike expectations.

WEEK AHEAD | KEY EVENTS

DATE	EVENT	WHY IT MATTERS
Tue Jun 9	EIA Short-Term Energy Outlook	Updated supply/demand forecasts; first official read post-latest Iran escalation. Inventory draw projections will move crude markets.
Wed Jun 11	May CPI Data	The critical print of the week. Hot = rate-hike pricing accelerates, hits all risk assets including crypto. Soft = relief rally opportunity. Most direct path to BTC price impact.
Jun 11-12	Fed Meeting / Communications	Hold is guaranteed at 99.4%. Language around 'further adjustments' and dot plot signals will indicate how seriously the board views the year-end hike scenario.
Ongoing	US-Iran Diplomatic Track	The wildcard. Credible ceasefire = oil drops sharply, risk appetite returns. Escalation = oil spike, inflation concerns worsen. Moves fast; no calendar date.
Ongoing	Crypto ETF Flow Data (Weekly)	Post-holiday institutional flow reversal would be the strongest near-term BTC signal. Watch Bitwise/21Shares HYPE ETF liquidity development.
