CRYPTO MARKET OVERVIEW

Week of June 8-13, 2026

FEAR & GREED INDEX

20-25

Fear - CMC: 25 / CryptoRank: 20

RECORD ETF OUTFLOWS

\$3.4B

Largest single-wk since Jan 2024

BTC FROM ATH (\$126K)

-50%

June cycle low: \$59,100

- \$3B+ in forced liquidations early June (272K+ traders in a single day); leveraged longs largely flushed. F&G: 20-25 (Fear).
- ETF outflow pace slowed materially in the June 8-13 window - early signs of bottom-fishing observed.
- MVRV ratio ~1.1: just above the historical undervaluation zone matching 2015, 2019, and 2022 cycle lows.
- Hyperliquid (HYPE) hit an all-time high of \$75.52 on June 2 - the standout performer of 2026 at +160% YTD.
- Humanity Protocol exploit June 8 wiped ~\$1B from H token. Private key failures are almost always preventable.

BITCOIN (BTC)

~\$64,000

TECHNICALS

Current Price	~\$64,000
ATH (Oct 6, 2025)	\$126,198
Drawdown from ATH	-49%
June Cycle Low	\$59,100
Market Cap	~\$1.27 Trillion
Critical Support	\$60,000 - \$62,000
Resistance	\$66,000 - \$68,000
200-Day EMA	\$76,000 - \$80,000
Perp Funding Rate	Slightly positive (unwinding)
MVRV Ratio	~1.1 (near undervaluation zone)

ON-CHAIN & ETF NARRATIVE

- MVRV ~1.1 is the most compelling on-chain signal: historically, readings below 1.0-1.2 have marked major cycle lows.
- Perp funding flipped slightly positive after months of negative: net-short positioning is unwinding, directionally constructive.
- \$3.4B single-week ETF outflow - record since launch. BlackRock IBIT: ~\$1.34B alone. Pace slowing into June 8-13.
- The ETF reversal is the catalyst to watch: the same mechanism that drove the 2025 rally works symmetrically on the way back.
- Bull scenario: Iran deal signed, oil falls, CPI trajectory reverses, ETF flows return, BTC breaks \$66K-\$68K.
- Bear scenario: Fed drops easing bias, yields spike, outflows accelerate, \$59,100 retested and broken toward \$54K.

ETHEREUM, SOLANA & ALTCOINS

Delayed Upgrades, RWA ATH, and a \$1B Hack

ETHEREUM

- Price: ~\$1,620-\$1,720 | -62% from \$4,953 ATH (Aug 2025) | Market cap ~\$200B
- Glamsterdam upgrade DELAYED: confirmed slip from June to Q3 2026, removing key near-term catalyst
- Upgrade features: gas limit 60M->200M blocks, 78% reduction in smart-contract gas, EIP-7732 PBS
- L2 adoption and DeFi fee revenues structurally intact; near-term macro headwinds dominate

SOLANA + ALTCOINS

- SOL: ~\$64-\$67 | Tokenized RWA on Solana hit \$2.7B ATH on June 10 (+34% from Q1)
- Tokenized SpaceX shares launched on Solana around the June 12 IPO - institutional RWA milestone
- Alpenglows consensus upgrade (targeting ~150ms finality) targeted Q3 2026
- Broad alts: capital concentrating in quality; speculative tokens still bleeding

ZCASH (ZEC)

- ~\$530, recovering strongly from ~50% crash on Orchard shielded pool bug disclosure.
- Pre-exploit peak ~\$543: Multicoin Capital privacy thesis (CBDC surveillance concerns).
- Emergency fix applied; Ironwood upgrade targets July (new shielded pool, supply fix).
- June 14: external audit clean, no new bugs. Core thesis intact. Chart still damaged.

SECURITY NOTE: HUMANITY PROTOCOL

- H token private-key exploit June 8 wiped ~\$1B. Partial recovery (+44%) followed.
- Not a smart-contract bug - a key compromise. Almost always preventable.
- Multi-sig, hardware wallets, air-gapped key generation: non-optional at scale.
- Your security hygiene is part of your investment thesis.

ATH
\$75.52

June 2, 2026

Now: ~\$58-\$63
(-21% from ATH)
+160% YTD

Best major token
of 2026.

ETF	Ticker	Fee	Launch	Notable
21Shares	THYP	0.30%	May 12	First mover
Bitwise	BHYP	0.34%*	May 15	*0% intro period
Grayscale	HYPG	0.29%	Jun 3	~2.2% staking yield
~99% of protocol fees -> HYPE buybacks. \$1B+ cumulative buybacks. \$857M fees earned in 2025. ~60% of global on-chain derivatives open interest. AQA v2 governance (Oct): adds USDC yield to buyback stream.				

MACRO OVERVIEW

Stagflation Framing Returns

MAY CPI (headline)

4.2%

YoY - 3-yr high; +4.2% Apr 2023

MAY PPI (headline)

6.5%

YoY - highest since Nov 2022

CORE CPI (ex-energy)

2.9%

YoY - 1 tick below consensus

HOW TO READ THESE NUMBERS

- Energy drove 60%+ of the monthly CPI increase (+3.9% MoM / +23.5% YoY) - entirely Iran/Hormuz supply shock, not demand-side.
- Core CPI at 2.9% confirms this is NOT a broad-based wage-price spiral. That matters enormously for the Fed's calculus.
- The 130bp gap between 4.2% headline and 2.9% core is the central tension: inflation is real but potentially self-correcting if Iran resolves.
- PPI at 6.5% is the pipeline warning: if the Iran deal fails and energy stays elevated, core will follow headline higher within 2-3 months.
- ECB hiked to 2.25% (effective June 17) - first major central bank hike since Sept 2023, explicitly citing the energy shock.

FOMC - WARSH'S FIRST MEETING

Jun 16-17 | Decision Wed 2pm ET

HOLD PROBABILITY

99.6%

Polymarket / 96.3% CME FedWatch

CURRENT RATE

3.50-3.75%

Unchanged; Warsh took over May 15

YR-END HIKE PROBABILITY

RISING

October flagged as live window

THE BASE CASE (HOLD)

- Rate stays 3.50-3.75% - near certainty. This is not a surprise; no market prep needed.
- Warsh's track record: publicly hawkish on inflation, critical of the Fed's late 2021-22 response.
- Press conference tone expected to be firm; he will acknowledge 4.2% headline without minimizing it.
- Key language: does 'easing bias' sentence survive? Its removal = hawkish signal even with a hold.

WHAT MARKETS ARE ACTUALLY TRADING

- Dot plot update: how many members now show a hike in 2026 or 2027 vs. previous projections?
- Statement language around 'further adjustments' or new neutral language = material market mover.
- Q&A tell: does Warsh distinguish headline vs. core, or treat 4.2% as the operative inflation level?
- ECB hiked last week - global tightening context means any Fed dovishness would be a relative surprise.

EQUITIES

Recovery Week + Largest IPO in History

NASDAQ (Fri close)

25,889

+0.31% wk; recovered from -4.18%

S&P 500 (Fri close)

7,431

+0.50% Fri; prev wk: 7,383

SpaceX IPO

\$75B

Largest IPO in history (Jun 12)

SpaceX Day-1 Return

+19%

Priced \$135; closed \$161.11

WHAT DROVE THE RECOVERY

- Core CPI 2.9% (1 tick below estimate) gave permission to rally - market read: energy shock, not spiral.
- SpaceX IPO euphoria: \$1.77T valuation; \$75B raised; more than 2x Saudi Aramco's 2019 record.
- Short-covering after the June 5 chip-stock selloff (Nasdaq -4.18%, worst since April 2025 tariffs).
- SpaceX ineligible for S&P 500 until June 2027 (IPO seasoning rule); Nasdaq inclusion is immediate.

WHAT TO WATCH HEADING INTO THIS WEEK

- SOX semiconductor index: if it stabilizes, tech leads next leg higher; if it breaks lower, Nasdaq follows.
- May retail sales (Wed pre-open): consumer health signal, especially under elevated energy burden.
- Post-IPO SpaceX trading: a sustained premium above \$135 supports broader risk appetite.
- VIX: spiked to 21.51 on June 5 (+39.68%). Normalization below 18 = fear dissipating.

OIL & GEOPOLITICS

Iran Deal: Signed, Sealed, Delivered?

WTI CRUDE

\$80-85

Down from \$138 April peak

BRENT CRUDE

\$84-88

Lowest since early March

HORMUZ SUPPLY HIT

~20%

Of global oil supply disrupted

POTENTIAL SIGNING

Jun 19

Switzerland - Juneteenth (mkt closed)

STATUS OF THE IRAN DEAL

- 14-point draft: Hormuz reopens within 30 days, oil sanctions lifted, nuclear program dismantled.
- Trump suggested Switzerland signing as soon as June 19. Conflicting Iranian state-media vs. WH versions of terms.
- IEA called the Hormuz closure 'the largest supply disruption in the history of the global oil market.'
- WTI fell 4%+ on deal optimism last week - the market is already partially pricing a resolution.

WHAT A SIGNED DEAL MEANS FOR EVERY ASSET

- Oil: WTI could fall to \$65-\$70 range within weeks; Brent below \$70 is possible if Hormuz fully reopens.
- CPI: energy component reverses hard; headline CPI trajectory improves materially within 1-2 months.
- Fed: disinflation impulse gives Warsh cover to stay neutral; rate hike scenario largely removed.
- Crypto: risk-on environment + dollar weakening + rate expectations easing = most bullish macro combo for BTC.

WEEK AHEAD

The Two Events That Define the Next Leg

MON JUN 15 | MEDIUM

FOMC Meeting Begins

Two-day meeting starts. Positioning day. Watch pre-meeting headlines for any Warsh signals.

FRI JUN 19 - MARKETS CLOSED | WILDCARD

Juneteenth + Possible Iran Signing

US stocks + bonds closed. Crypto and oil trade 24/7 - they price the deal first. Switzerland signing reported targeting this date.

WED JUN 17 - CRITICAL | CRITICAL

FOMC Decision + Retail Sales

Hold certain. The real question: easing-bias language survives? Dot plot hawkishness? Warsh press conf. 2:30pm ET. Retail sales pre-open.

ONGOING | WILDCARD

US-Iran Deal Watch

The override event. Signed deal = oil collapses, disinflation, risk-on rally for BTC. Collapse = oil re-spikes, Fed forced toward hike, BTC retests \$59,100.

THU JUN 18 | MEDIUM

Weekly Jobless Claims

Labor market health check. Strong = more hike pressure. Weak = gives Fed breathing room.
